

Online Grocery Order System

Wireframe

Creating a wireframe for an Online Grocery Order System involves designing the basic layout and structure of the user interface without including detailed design elements or graphics. Wireframes are typically used to outline the placement of elements, navigation, and overall flow of the application.

Description of Elements:

- **Header:** Contains the website's name or logo, and a shopping cart icon that indicates the number of items in the cart. The 'X' is a close button for the header.
- **Search Bar:** Allows users to search for specific products.
- **Cart:** Displays a summary of the items in the user's shopping cart.
- **Product Categories:** A list of categories that users can click to filter products.
- **Product List:** Displays a list of products available in the selected category. Each product typically includes an image, name, description, and price.

- **Pagination:** If there are many products, pagination controls (e.g., "Previous" and "Next" buttons) allow users to navigate through pages of product listings.
- **Footer:** Contains links to various sections of the website, such as "About Us," "Contact Us," and "Privacy Policy."

This wireframe represents the main screen where users can browse and select products. The provided video demo of the project along with the live accessible website demo provide a more detailed view of the above features.
